

DESIGN SYSTEM UPGRADE MIGRATION

ABSTRACT OF THE DISCLOSURE

A software tool is created to migrate computer files that define ICs from older to newer computer-readable directory structures. The old and new directories are compared to identify differences that are mapped and sorted on the basis of directory source names. A computer file defining an IC is migrated by identifying source names in the file that are referenced by the tool. For each identified source name, the associated directory reference is changed from the old to the new directory structure.
